

**Directions:** Solve 5 of the following 6 problems. All written work must be your own, using only permitted sources. See the “General Guidelines and Advice” on the homework page for more details.

1. Prove that the complement of a disconnected graph is connected.
2. Find a  $P_6$ -decomposition of the Petersen graph or show that no such decomposition exists.
3. In a graph, a  $uv$ -path is a path with endpoints  $u$  and  $v$ . Prove that if  $G$  has a  $uv$ -path of length at least  $k^2$  and some cycle in  $G$  contains  $u$  and  $v$ , then  $G$  has a cycle of length at least  $k + 1$ .
4. Let  $G$  be a graph with girth 4 in which every vertex has degree  $k$ . Prove that  $G$  has at least  $2k$  vertices. Determine all such graphs with exactly  $2k$  vertices.
5. Prove that a self-complementary graph with  $n$  vertices exists if and only if  $n = 4k$  or  $n = 4k + 1$  for some integer  $k$ . Hint: When  $n$  is divisible by 4, generalize the structure of  $P_4$  by splitting the vertices into four groups. For  $n$  of the form  $n = 4k + 1$ , add one vertex to the graph constructed for  $n = 4k$ .
6. Let  $G$  be a simple graph in which every vertex has degree 3. Prove that  $G$  decomposes into claws if and only if  $G$  is bipartite.
